# Lectures and Labs

---

- This weeks lectures and labs are based on examples in:
  - Objects First with Java - A Practical Introduction using BlueJ, © David J. Barnes, Michael Kölling (<https://www.bluej.org/objects-first/>)

# Topic List

---

- 
- 
1. Social Network V1
  2. Inheritance hierarchies
  3. Social Network V2
  4. Coding inheritance hierarchies
    - Super and subclasses
    - Using constructors in these hierarchies
  5. Social Network V3
    - Deeper hierarchies
    - Advantages of using inheritance
  6. Subtyping and Substitution
  7. Polymorphic variables / Collections
    - Includes casting, wrapper classes, autoboxing /unboxing

# Social Network V1

- A small, prototype SOCIAL NETWORK.
- Supports a **News Feed** with posts.
- POSTS:
  - **MessagePost:**
    - multi-line text message.
  - **PhotoPost:**
    - photo and caption.
  - Operations
    - e.g., search, display and remove.

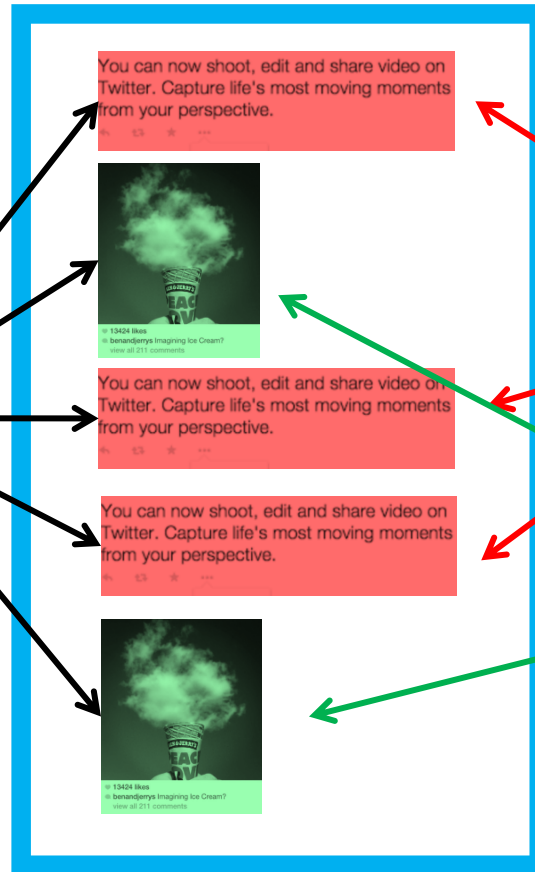

# SOCIAL NETWORK

## NEWS FEED

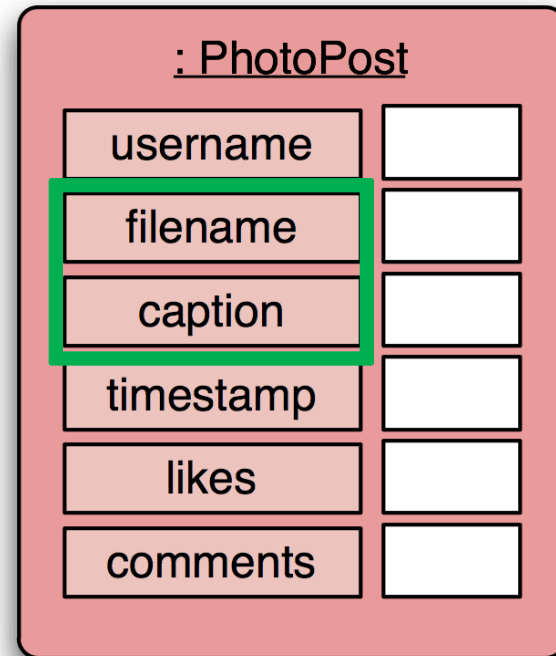

POSTS

Multi Line Text

Photo

# Social Network V1 - Objects

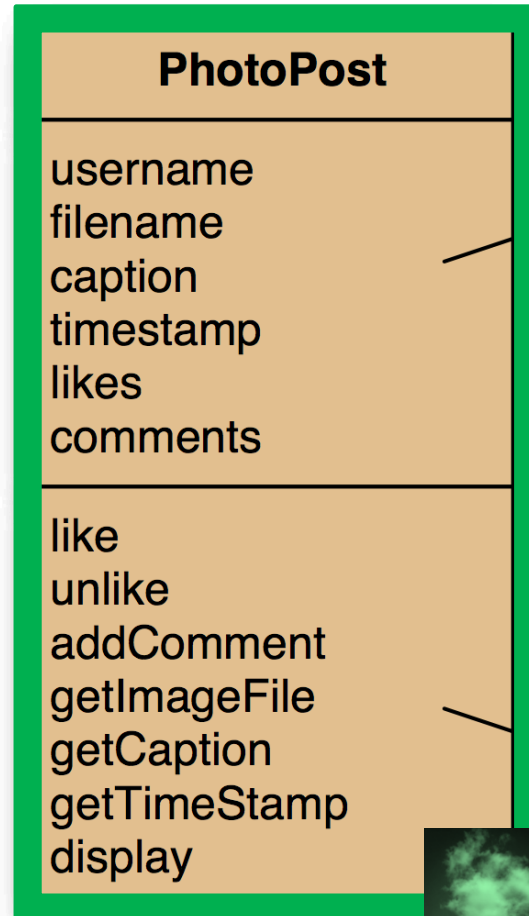

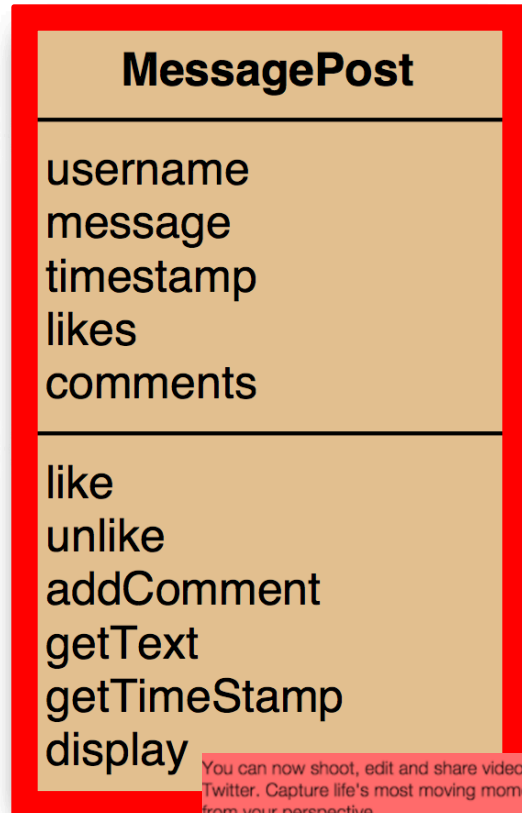

You can now shoot, edit and share video on Twitter. Capture life's most moving moments from your perspective.

**MessagePost:**  
multi-line text  
message.

**PhotoPost:**  
photo and caption.

# MessagePost source code

You can now shoot, edit and share video on Twitter. Capture life's most moving moments from your perspective.

*Just an  
outline...*

```
public class MessagePost
{
    private String username;
    private String message;
    private long timestamp;
    private int likes;
    private ArrayList<String> comments;

    public MessagePost(String author, String text)
    {
        username = author;
        message = text;
        timestamp = System.currentTimeMillis();
        likes = 0;
        comments = new ArrayList<String>();
    }

    public void addComment(String text) ...

    public void like() ...

    public void display() ...

    ...
}
```

## PhotoPost source code

*Just an  
outline...*

```
public class PhotoPost
{
    private String username;
    private String filename;
    private String caption;
    private long timestamp;
    private int likes;
    private ArrayList<String> comments;

    public PhotoPost(String author, String filename,
                     String caption)
    {
        username = author;
        this.filename = filename;
        this.caption = caption;
        timestamp = System.currentTimeMillis();
        likes = 0;
        comments = new ArrayList<String>();
    }

    public void addComment(String text) ...

    public void like() ...

    public void display() ...
    ...
}
```

# NewsFeed source code

```
public class NewsFeed
{
    private ArrayList<MessagePost> messages;
    private ArrayList<PhotoPost> photos;
    ...
    public void show()
    {
        for(MessagePost message : messages) {
            message.display();
            System.out.println(); // empty line
between posts
        }

        for(PhotoPost photo : photos) {
            photo.display();
            System.out.println(); // empty line
between posts
        }
    }
}
```

6. Subtyping and Substitution
7. Polymorphic variables / Collections
  - Includes casting, wrapper classes, autoboxing /unboxing

# Recap: Social Network V1 - Class diagram

---

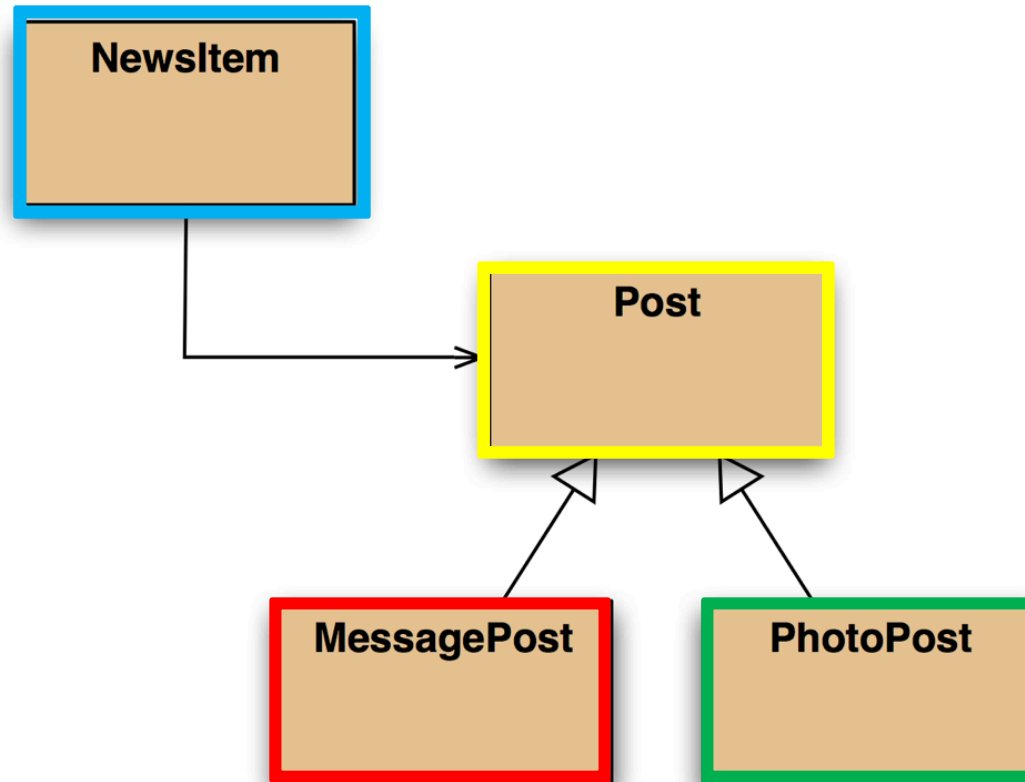

# Critique of Social Network V1

---

- Code duplication:
  - **MessagePost** and **PhotoPost** classes very similar (large parts are identical)
  - makes maintenance difficult/more work
  - introduces danger of bugs through incorrect maintenance
- Code duplication in **NewsFeed** class as well.

# Social Network V2 - Class diagram

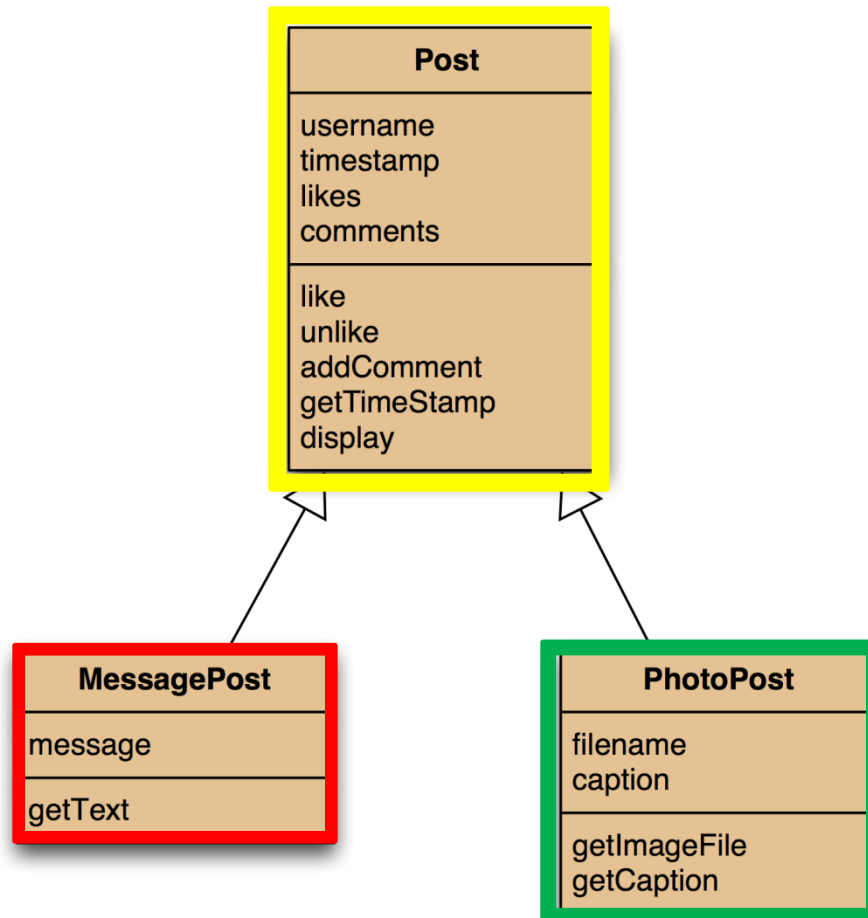

You can now shoot, edit and share video on Twitter. Capture life's most moving moments from your perspective.

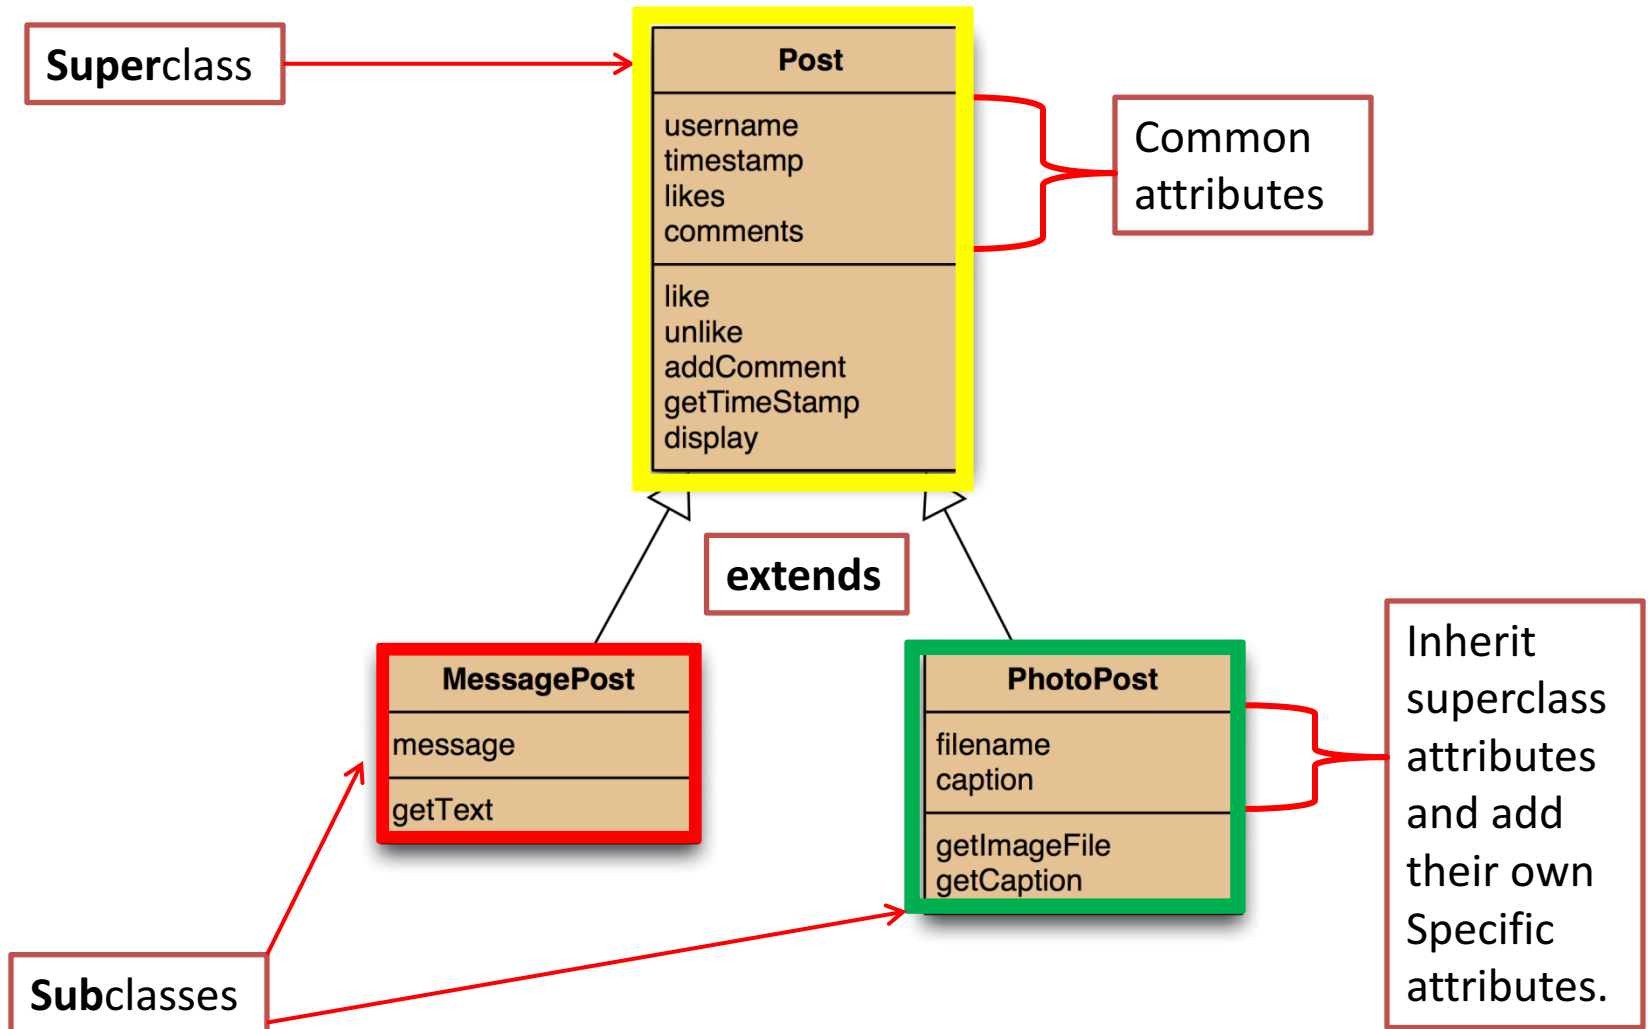

# Social NetworkV2 - Using inheritance

---

# Social NetworkV2 - Using inheritance

# Social Network V2 – Inheritance Summary

---

- define one **superclass**
  - **Post**
- define **subclasses** for
  - **MessagePost**
  - **PhotoPost**
- the **superclass**
  - defines common attributes (via fields)
- the **subclasses**
  - **inherit** the superclass attributes (fields)
  - add other specific attributes (fields)

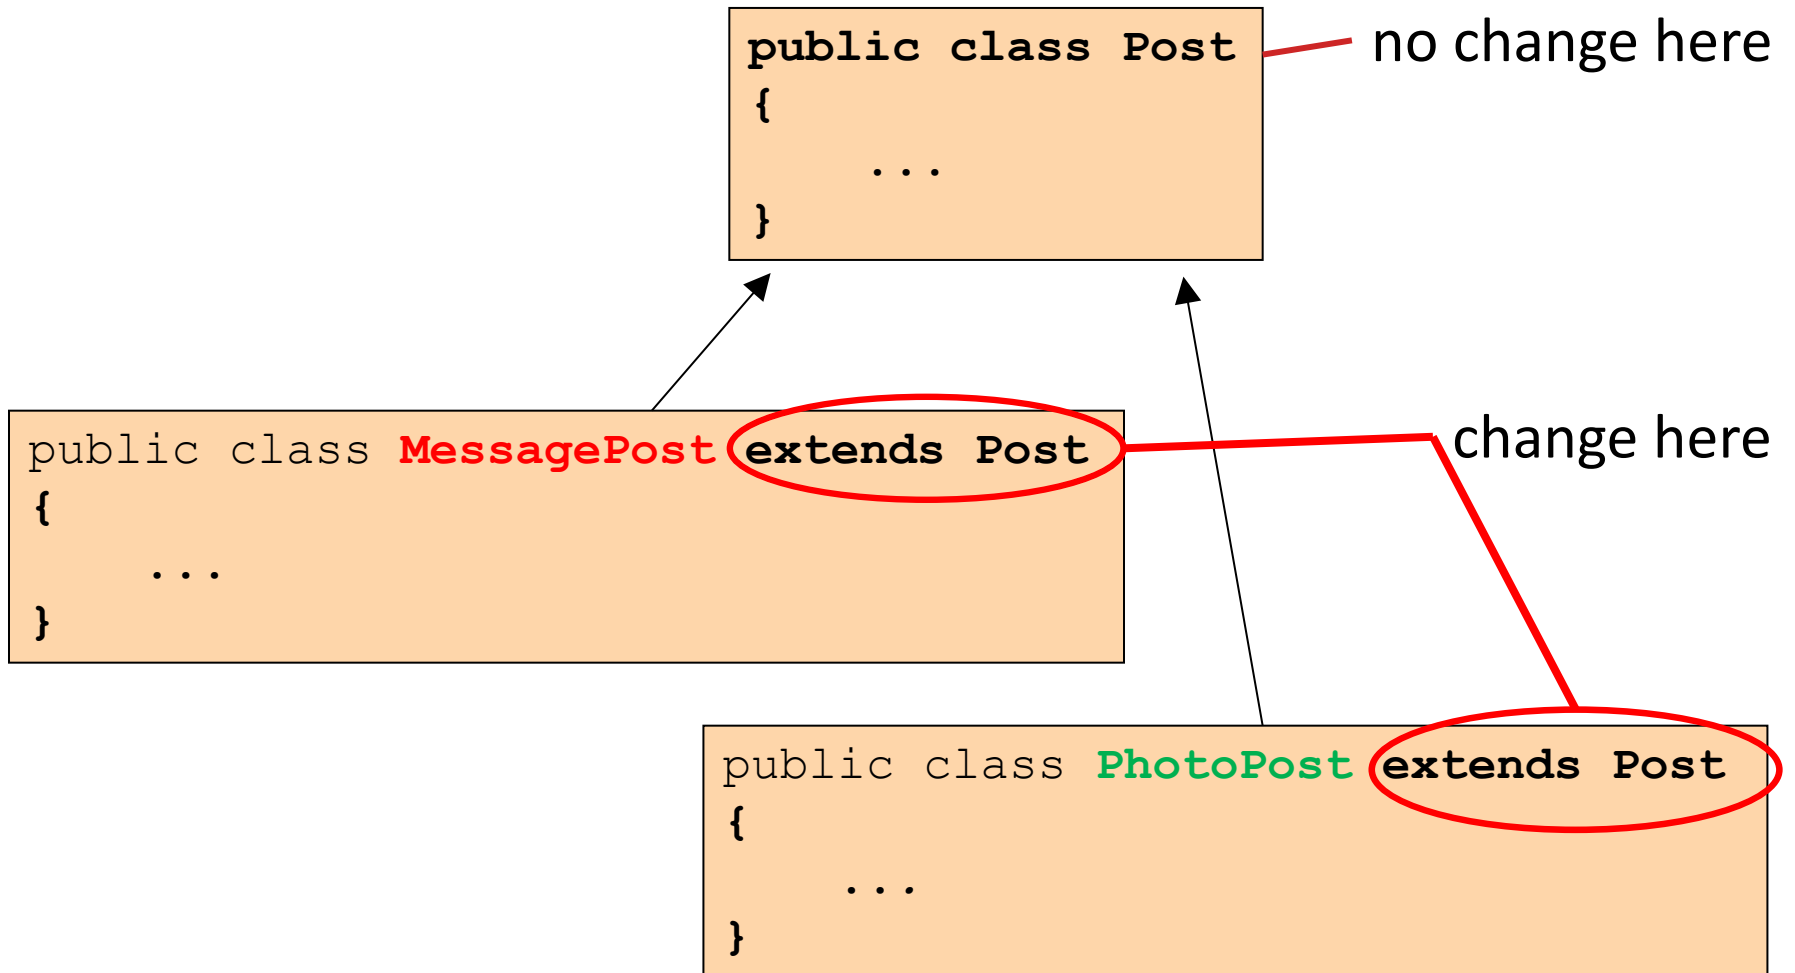

# Topic List

---

1. Social Network V1
2. Inheritance hierarchies
3. Social Network V2
4. Coding inheritance hierarchies
  - **Super** and **subclasses**
  - Using **constructors** in these hierarchies
5. Social Network V3
  - Deeper hierarchies
  - Advantages of using inheritance
6. Subtyping and Substitution
7. Polymorphic variables / Collections
  - Includes casting, wrapper classes, autoboxing /unboxing

# Inheritance in Java - extends

---

# Superclass

---

```
public class Post
{
    private String username;
    private long timestamp;
    private int likes;
    private ArrayList<String> comments;

    // constructor and methods omitted.
}
```

# Subclasses

---

```
public class MessagePost extends Post
{
    private String message;

    // constructor and methods omitted.
}
```

```
public class PhotoPost extends Post
{
    private String filename;
    private String caption;

    // constructor and methods omitted.
}
```

# Inheritance and Constructors - superclass

```
public class Post
{
    private String username;
    private long timestamp;
    private int likes;
    private ArrayList<String> comments;

    /**
     * Initialise the fields of the post.
     */
    public Post(String author)
    {
        username = author;
        timestamp = System.currentTimeMillis();
        likes = 0;
        comments = new ArrayList<String>();
    }

    // methods omitted
}
```

# Inheritance and Constructors - subclass

```
public class MessagePost extends Post
{
    private String message;

    /**
     * Constructor for objects of class MessagePost
     */
    public MessagePost (String author, String text)
    {
        super(author);
        message = text;
    }

    // methods omitted
}
```

# Superclass constructor call

---

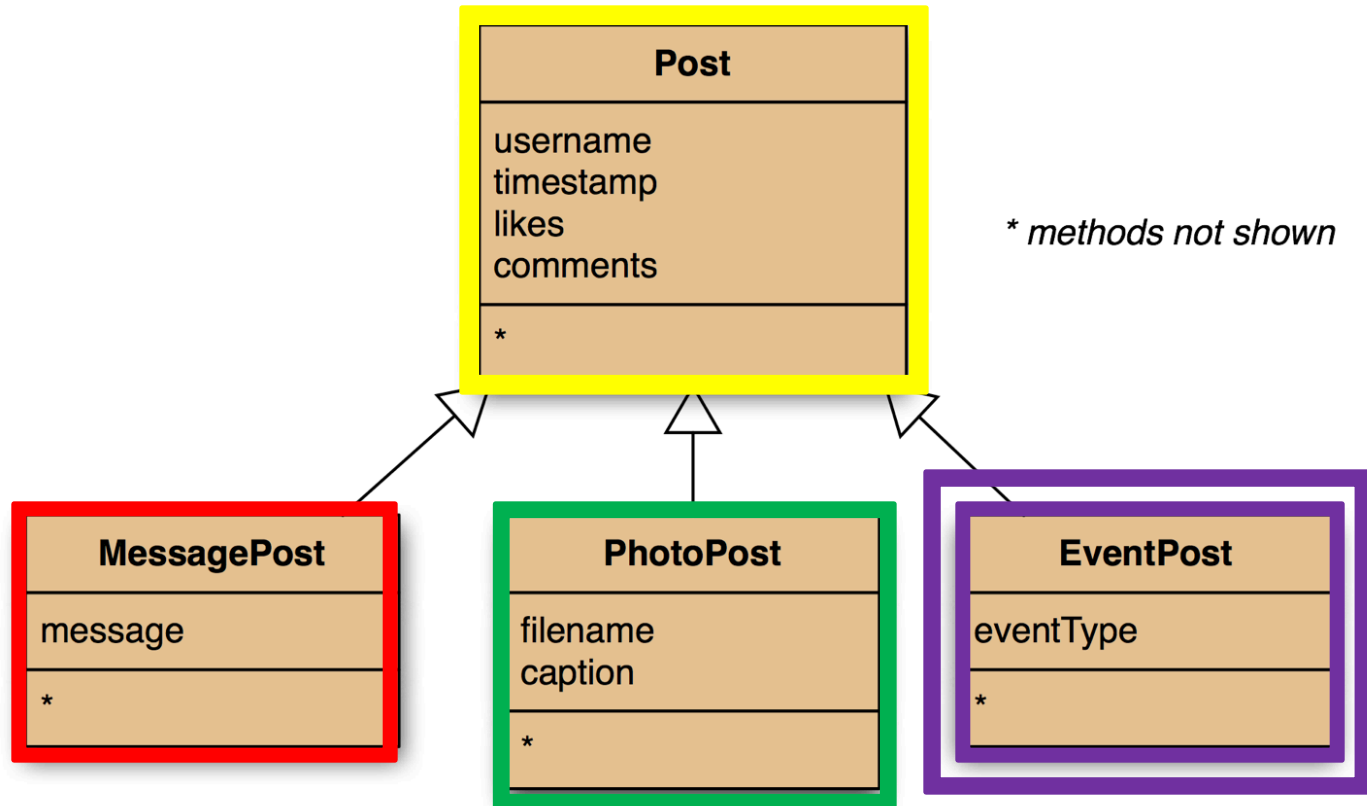

- Subclass constructors must always contain a **'super'** call.
- If none is written, the compiler inserts one (without parameters)
  - works only, if the superclass has a constructor without parameters
- 'super' call must be the first statement in the subclass constructor.

# Topic List

---

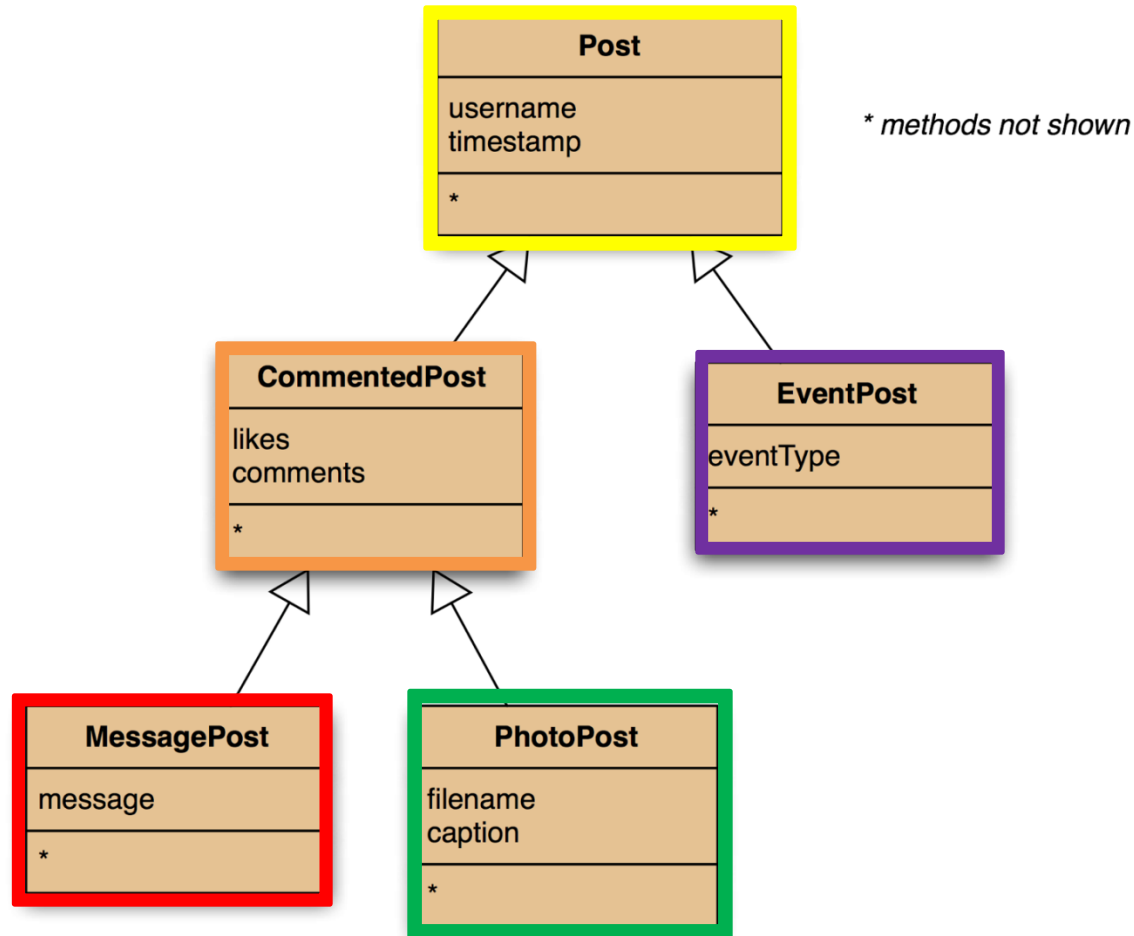

1. Social Network V1
2. Inheritance hierarchies
3. Social Network V2
4. Coding inheritance hierarchies
  - Super and subclasses
  - Using constructors in these hierarchies
5. Social Network V3
  - Deeper hierarchies
  - Advantages of using inheritance
6. Subtyping and Substitution
7. Polymorphic variables / Collections
  - Includes casting, wrapper classes, autoboxing /unboxing

# Social Network V3 - Adding more item types

# Social Network V3 - Deeper hierarchies

---

# Topic List

---

1. Social Network V1
2. Inheritance hierarchies
3. Social Network V2
4. Coding inheritance hierarchies
  - Super and subclasses
  - Using constructors in these hierarchies
5. Social Network V3
  - Deeper hierarchies
  - Advantages of using inheritance
6. Subtyping and Substitution
7. Polymorphic variables / Collections
  - Includes casting, wrapper classes, autoboxing /unboxing

# Advantages of inheritance

---

Inheritance (so far) helps with:

- Avoiding code duplication
- Code reuse
- Easier maintenance
- Extendibility

```
public class NewsFeed
{
    private ArrayList<Post> posts;

    /**
     * Construct an empty news feed.
     */
    public NewsFeed()
    {
        posts = new ArrayList<Post>();
    }

    /**
     * Add a post to the news feed.
     */
    public void addPost(Post post)
    {
        posts.add(post);
    }
    ...
}
```

## REVISED NewsFeed source code

*Code is  
simplified  
&  
code  
duplication in  
the client  
class is  
avoided!*

## REVISED NewsFeed source code

```
/**
 * Show the news feed. Currently: print the
 * news feed details to the terminal.
 */

public void show()
{
    for(Post post : posts) {
        post.display();
        System.out.println(); // Empty line ...
    }
}
```

# Topic List

---

1. Social Network V1
2. Inheritance hierarchies
3. Social Network V2
4. Coding inheritance hierarchies
  - Super and subclasses
  - Using constructors in these hierarchies
5. Social Network V3
  - Deeper hierarchies
  - Advantages of using inheritance
-  6. Subtyping and Substitution
7. Polymorphic variables / Collections
  - Includes casting, wrapper classes, autoboxing /unboxing

# Subtyping

---

First, we had:

```
public void addMessagePost(MessagePost message)
public void addPhotoPost(PhotoPost photo)
```

Now, we have:

```
public void addPost(Post post)
```

We call this method with:

```
PhotoPost myPhoto = new PhotoPost(...);
feed.addPost(myPhoto);
```

# Subclasses and subtyping

---

- Classes define *types*.
- Subclasses define *subtypes*.
- **Substitution:**
  - objects of *subclasses* can be used where objects of *supertypes* are required.

# Subtyping and assignment

---

*subclass objects  
may be assigned to  
superclass variables*

```
Vehicle v1 = new Vehicle();
Vehicle v2 = new Car();
Vehicle v3 = new Bicycle();
```

# Subtyping and parameter passing

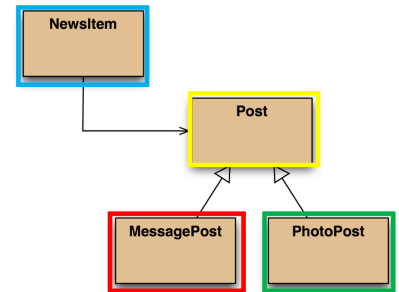

```
public class NewsFeed
{
    public void addPost(Post post)
    {
        ...
    }
}
```

```
PhotoPost photo = new PhotoPost(...);
```

```
MessagePost message = new MessagePost(...);
```

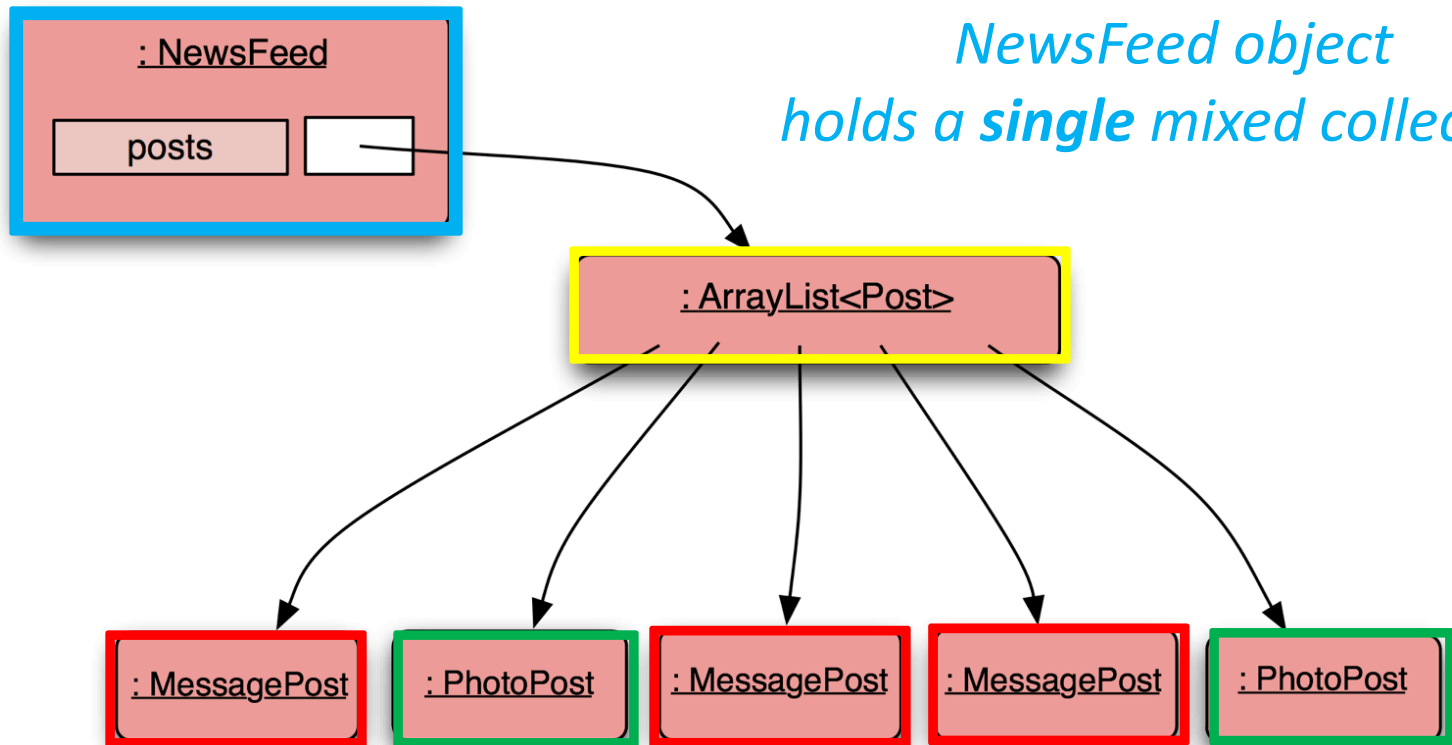

```
feed.addPost(photo);
```

```
feed.addPost(message);
```

*subclass objects  
may be used as actual parameters  
when a superclass is required.*

# Social Network V2 - Object diagram

*NewsFeed object holds a single mixed collection*

# Topic List

---

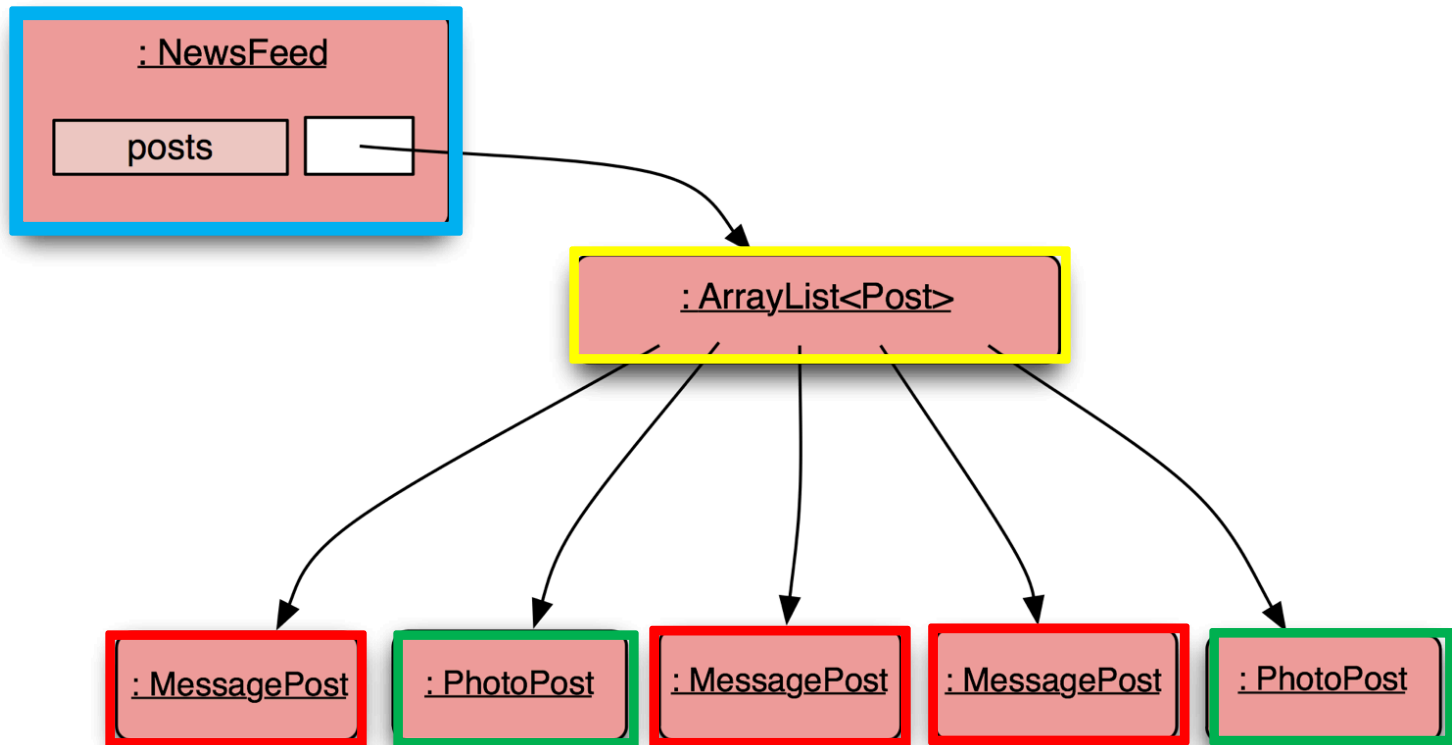

1. Social Network V1
2. Inheritance hierarchies
3. Social Network V2
4. Coding inheritance hierarchies
  - Super and subclasses
  - Using constructors in these hierarchies
5. Social Network V3
  - Deeper hierarchies
  - Advantages of using inheritance
6. Subtyping and Substitution
- 7. Polymorphic**
  - a) Variables
  - b) Collections
    - ccasting, wrapper classes, autoboxing /unboxing

# Polymorphic variables

---

- Object variables in Java are **polymorphic**
  - they can hold objects
    - of more than one type
    - of the declared type
    - or of subtypes of the declared type.

# Social Network V2 – polymorphic ArrayList of Post

# Casting

We can assign **subtype** to **supertype** (note arrow direction)!

**But** we cannot assign a **supertype** to **subtype** (cannot go against the arrows)!

```
Vehicle v;  
Car c = new Car();  
v = c;           // correct (car is-a vehicle)  
c = v;           // compile-time error!  
c = (Car) v;     // casting..correct (only if the vehicle really is a Car!)
```

Without  
(CASTING)

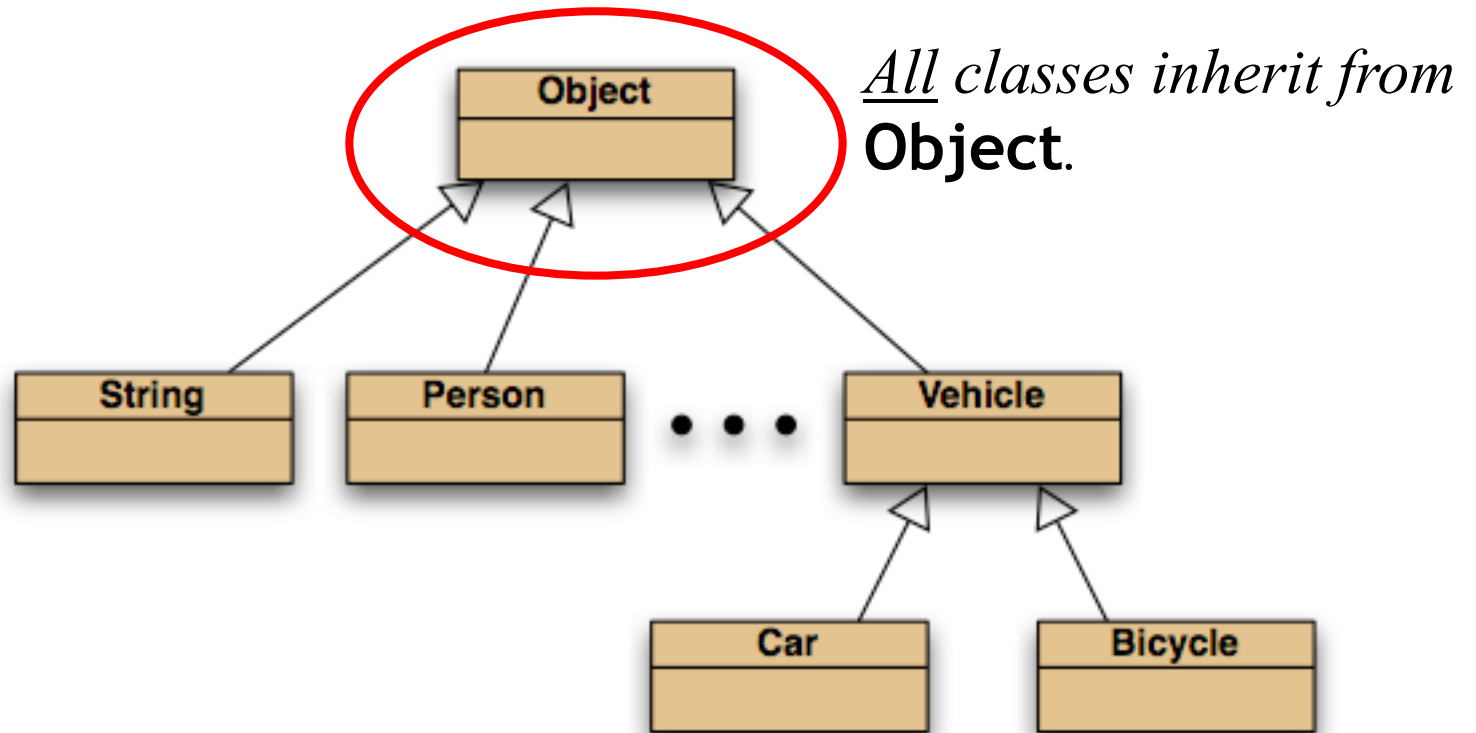

# Casting

---

- An object type in parentheses.
- Used to overcome 'type loss'.
- The object is not changed in any way.
- A runtime check is made to ensure the object really is of that type:
  - **ClassCastException** if it isn't!
- Use it sparingly.

# The Object class

---

# Topic List

---

1. Social Network V1
2. Inheritance hierarchies
3. Social Network V2
4. Coding inheritance hierarchies
  - Super and subclasses
  - Using constructors in these hierarchies
5. Social Network V3
  - Deeper hierarchies
  - Advantages of using inheritance
6. Subtyping and Substitution
- 7. Polymorphic**
  - a) Variables
  - b) Collections
    - ccasting, wrapper classes, autoboxing /unboxing

# Polymorphic collections

---

- All collections are polymorphic.
- The elements could simply be of type **Object**.

```
public void add(Object element)  
public Object get(int index)
```

- Usually avoided...
  - we typically use a type parameter with the collection.

# Polymorphic collections

---

- With a type parameter the degree of polymorphism: **`ArrayList<Post>` is limited.**
  - Collection methods are then typed.
- Without a type parameter, **`ArrayList<Object>` is implied.**
  - Likely to get an “*unchecked or unsafe operations*” warning.
  - More likely to have to use casts.

# Collections and **primitive types**

---

- Potentially,  
all objects can be entered into collections
  - because collections can accept elements of type **Object**
  - and all classes are subtypes of **Object**.
- Great! But what about *the primitive types*:  
**int, boolean**, etc.?

# Wrapper classes

---

- Primitive types are not object types.  
Primitive-type values must be wrapped in objects to be stored in a collection!
- **Wrapper** classes exist for all primitive types:

<i>primitive type</i>	<i>wrapper class</i>
int	Integer
float	Float
char	Character
...	...

Note that there is no simple mapping rule from primitive name to wrapper name!

# Wrapper classes

---

```
int i = 18;  
Integer iwrap = new Integer(i);  
  
...  
int value = iwrap.intValue();
```

wrap the value

unwrap it

The diagram illustrates the process of wrapping and unwrapping a value. It shows two lines of code: `Integer iwrap = new Integer(i);` and `int value = iwrap.intValue();`. An arrow points from the text "wrap the value" to the `i` parameter in the `Integer` constructor. Another arrow points from the text "unwrap it" to the `intValue()` method call.

In practice,  
*autoboxing* and *unboxing*  
mean we don't often have to do this explicitly

# Autoboxing and unboxing

---

```
private ArrayList<Integer> markList;  
...  
public void storeMark(int mark)  
{  
    markList.add(mark);  
}
```

autoboxing

i.e. we don't have to worry about explicitly wrapping **mark** above

```
int firstMark = markList.get(0);
```

unboxing

Or explicitly unwrapping the first mark in the list **markList.get(0)**

# Review

---

- Inheritance allows the definition of classes as extensions of other classes.
- Inheritance
  - avoids code duplication
  - allows code reuse
  - simplifies the code
  - simplifies maintenance and extending
- Variables can hold subtype objects.
- Subtypes can be used wherever supertype objects are expected (substitution).

**Any  
Questions?**
